

SPINPRO WILDLIFE FEEDERS

METAL SPINNER PLATE

Replacement Instructions

Removal: Black Plastic Spinner Plates are pressed onto the motor shaft. There is no screw or adhesive holding it in place. To remove this spinner plate, place your fingers under BOTH sides of the plate and pull up toward the feeder funnel. The spinner plate should pull free off the motor shaft.

Metal Spinner Plates are attached to the motor shaft with an Allen screw located on a metal hub under the spinner plate. Using the correct size Allen wrench, turn this screw about one turn counter-clockwise until the plate is loose. Pull the plate up toward the feed funnel to remove it.

Replacement: Metal Spinner Plates have Allen screw located on a metal hub under the spinner plate. Place the spinner plate hub over the motor shaft with the Allen screw aligned with the flat on the motor shaft. Using the correct size Allen wrench, tighten the screw securely against the motor shaft.
